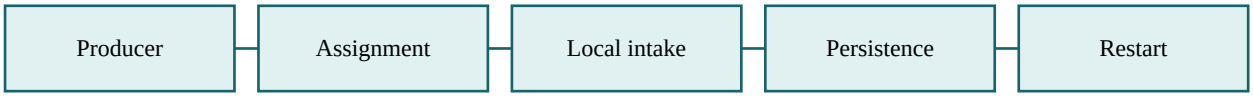
Tracera runtime delta

Later observation - existing dossier remains immutable



Text alternative: real output flows through explicit product assignment and authenticated local intake to durable storage, readback and restart/replay.

Exact runtime subject

Tracera 2f1d36dc5264e0b36811036913ed9b47083ef968; clean isolated source. Binary SHA-256 6be5a8d8c29091ccd46a192b27467f6f78626a5d5262f6c6dc19882f249c08c9. Observed 2026-10-17T19:56:05Z to 2026-10-17T20:37:44Z. SQLite on owned loopback; stopped after verification.

Fresh authenticated gates

Readiness 200; anonymous 401; absent baseline 404; missing CSRF 403; malformed batch 422. These are isolated runtime facts, not deployed product qualification.

Genuine engineering observation

The actual runtime receipt was hashed and manually assigned to authenticated durable intake. Mounted generic ingest accepted one observation. Readback, exact process restart, retry without duplication, foreign-scope rejection, and immutable-conflict rollback passed.

Actual producer bridge

Producer source f36e13e650dfc322e2e541d3e9b152638aeccd47; controlled subject a86c86f8a8010cf6ef0bc3f61b7a743ba2727c14. The real Helios script ran three deliberately trivial print commands. Its original output was ingested through the mounted benchmark route, read back, restarted and replayed. Causal identities matched exactly. This is producer/consumer plumbing proof, not valuable benchmark acceptance.

Substantive producer workload

The actual Helios runner invoked the real Tracera runtime invariant probe against exact source 2f1d36dc and binary 6be5a8d8. The test returned 0 in 820 ms after readiness/auth/CSRF/error, durable ingest/read, foreign-scope and immutable conflict controls, exact restart and replay assertions. Its new benchmark output was then consumed through Tracera mounted bridge with read/restart/replay/conflict controls. This is real producer/consumer engineering integration on a controlled subject; manual product assignment, unsigned producer identity and no user acceptance remain.

Limits and next useful result

Unsigned tenant metadata and a caller-controlled local bearer do not establish external producer ownership. Product/capability assignment was explicit and manual. No actual person accepted a journey. Next: meaningful owned-product workload, authenticated producer binding, source-change reconciliation, and consumer navigation.

Four-axis delta

Implementation: unchanged in this observation. Engineering assurance: new exact-patched-subject runtime evidence, unreviewed. Complete user-usable journeys: no accepted increment. Real user validation: not observed. Full-product numerator/denominator remain null; no completion percentage assigned.

Integrity and continuity

The existing 31-page PDF and locked snapshot are unchanged. This later append-only observation does not retroactively change their as-of date. Hashes identify bytes, not author authenticity. Requalify when relevant source, dependencies, runtime configuration, Store or evaluator changes.
